

It's time to get smart, avoid the high costs and risks of desktop computer ownership, yet still harness their local power!

The industry may have come full circle, with emphasis on central servers, but now enjoy the best of both worlds, licence free, more secure, easier maintained, at lower cost.

We'd like to show how you can use standard computer equipment in a smarter way.....

- ❑ Low cost, fast, computers for most staff - *like thin clients but different!*
- ❑ Licence free office, internet programs for those typical business needs
- ❑ Central low cost, management of virus, spam, spyware – *all in one place!*
- ❑ Secure firewalls for remote branch/mobile access to business data
- ❑ Centrally controlled file servers for all business data, with backup
- ❑ Access from anywhere to email, contacts, appointments, web content
- ❑ Low cost telephone systems and GSM gateways that are computer based
- ❑ Yet still catering for special workstation/server applications if necessary

Why are businesses today often risking their money at the wrong end of technology, buying lots of expensive desktop computers, and using outdated communications and facilities?

We take a more simple business view of what ICT should be.

- ❑ **Information** - businesses must firstly keep their data safe, backed up and accessible
- ❑ **Communications** - the need for voice and data access anywhere and anytime for all staff
- ❑ **Technology** - is just equipment, software & services to store data, access it and to communicate

So put ICT in the right context. First, get the right servers in place, centralise all the tools and facilities and then back them up – everybody should be doing that. Now put really low cost, almost disposable technology into the hands of staff so that they are always working with simple equipment. Control what all those desktop computers are doing so that they work for the business, not deter from it. You can then get back to work on making your business grow and leave the servers under the care of ICT professionals.

How does this approach compare to your business situation?

“There are some well proven technologies available, but the real solution rests in having someone sensibly integrate them into an effective overall, well supported business facility. “

See what Gary Pope has to say on this subject with you. We're not talking about “thin clients” here, we're talking about using fast, low cost powerful equipment as **smart thin clients**
